

Comprehensive QA Report

OrangeHRM Test Automation Project

Document ID: QA-OHRM-MASTER

Prepared for: Client Review

Author: Abhishek K M

Date: July 20, 2026

Status: Baseline v1.0

1. Executive Summary & Closure Recommendation

Recommendation: CONDITIONAL SIGN-OFF

The OrangeHRM automation project has achieved the required coverage across 5 key modules using Cypress and Playwright. We recommend signing off on Login, Admin, PIM, and Dashboard modules. Sign-off for the Leave module is withheld pending a fix for a high-severity data-integrity defect (DEF-OHRM-003).

1.1 Coverage Achieved

Dimension	Planned	Achieved	Comment
Requirements (RTM)	27	25 full + 2 partial	Partial coverage due to untestable email flows and backlog navigation elements.
Test Cases Automated	55 × 2 frameworks	55 × 2	100% of in-scope requirements traced. Full dual-framework parity.
Test Execution	110	106 (4 blocked)	Blocked cases due to shared-tenant environment reset; scheduled for re-run.
Pass Rate	≥95% Target	98.1% (Both)	Single failure is a confirmed AUT defect, not a script error.

2. Test Strategy & Architecture

2.1 Scope & Tooling

The automation suite covers business-critical flows across five OrangeHRM modules. To demonstrate a resilient and tool-agnostic framework architecture, the identical test design is implemented in both **Cypress** and **Playwright**.

Module	Flows Covered
Login	Valid login, invalid credential matrix, error assertions, redirect protection.
Admin	Search system users, add/edit/delete users, grid assertions, form validations.
PIM	Add employee (with/without login), search, edit personal details, delete.
Leave	Apply leave, filtering (date/status/type), verify applied leave visibility.
Dashboard	Post-login landing verification, core widgets, quick-launch navigation.

2.2 Framework Design

The framework utilizes a multi-layered Page Object Model (POM) architecture to mitigate locator churn risk caused by OrangeHRM's dynamic UI.

- **CI Layer:** GitHub Actions handling PR smoke tests and nightly regression.
- **Test Layer:** Spec files containing Arrange, Act, and Assert logic.
- **Page Object Layer:** State management and locator housing.
- **Support Layer:** Fixtures, unique data generators, and session reuse utilities.

3. Test Execution Summary

Final regression cycle concluded on July 20, 2026. The two frameworks executed the exact same catalogue and reached identical verdicts, verifying total parity.

3.1 Results by Module (Combined Cypress & Playwright Parity)

Module	Executed (per tool)	Passed	Failed	Blocked	Pass %
Login	11	11	0	0	100%
Admin	12	12	0	0	100%
PIM	12	12	0	0	100%
Leave	9	8	1	2	88.9%

Module	Executed (per tool)	Passed	Failed	Blocked	Pass %
Dashboard	9	9	0	0	100%
Total	53	52	1	2	98.1%

4. Defect Summary

The following Application Under Test (AUT) defects were captured during execution.

DEF-OHRM-001: Intermittent HTTP 500 on Login Page

Severity: Critical | **Priority:** P2

Description: /web/index.php/auth/login intermittently returns an HTTP 500 server error under rapid successive login cycles, temporarily blocking system access. It self-recovers after a few seconds.

Impact: Deemed critical due to temporary total loss of function, but downgraded to P2 priority due to trivial user workaround (retry) and suspected root cause being shared-tenant rate-limiting rather than application code.

DEF-OHRM-003: Invalid Leave Date Range Accepted via Keyboard Input

Severity: High | **Priority:** P2

Description: The "Leave Apply" form accepts a "To" date that is earlier than the "From" date when values are typed manually (bypassing the calendar widget). This allows corrupted leave requests with negative duration into the system.

Impact: Silent data corruption in a core HR flow blocks sign-off of the Leave module. Requires immediate remediation prior to production launch.

DEF-OHRM-004: Employee Name Header Stale After Edit

Severity: Medium | **Priority:** P3

Description: After updating an employee's personal details, the page header continues to display the old name until a manual page refresh is triggered.

DEF-OHRM-002: Unhandled JS Exception During Logout

Severity: Low | **Priority:** P3

Description: Terminating the dashboard via rapid logout triggers uncaught `TypeError` exceptions from in-flight XHR requests. No functional user impact, but pollutes monitoring dashboards.
